# Project Overview and Definition

Personal Data Automatic Detection in Social Media Apps.

BuzzHub is an Instagram-like app where users are registered using Optical Character Recognition to read the information of identification documents and use facial recognition technology to verify the user's likeness off their identification documents.

# PROJECT TIMELINE

# FEATURES

User Registration and Login.

Able to read information from identification documents.

Able to like/unlike posts.

Able to use facial recognition to train a model and identify the user.

Able to preview user profiles.

You can view your feed.

Able to comment on posts.

Able to follow/unfollow other users.

Users of the application can send direct messages to each other.

# AI FEATURES

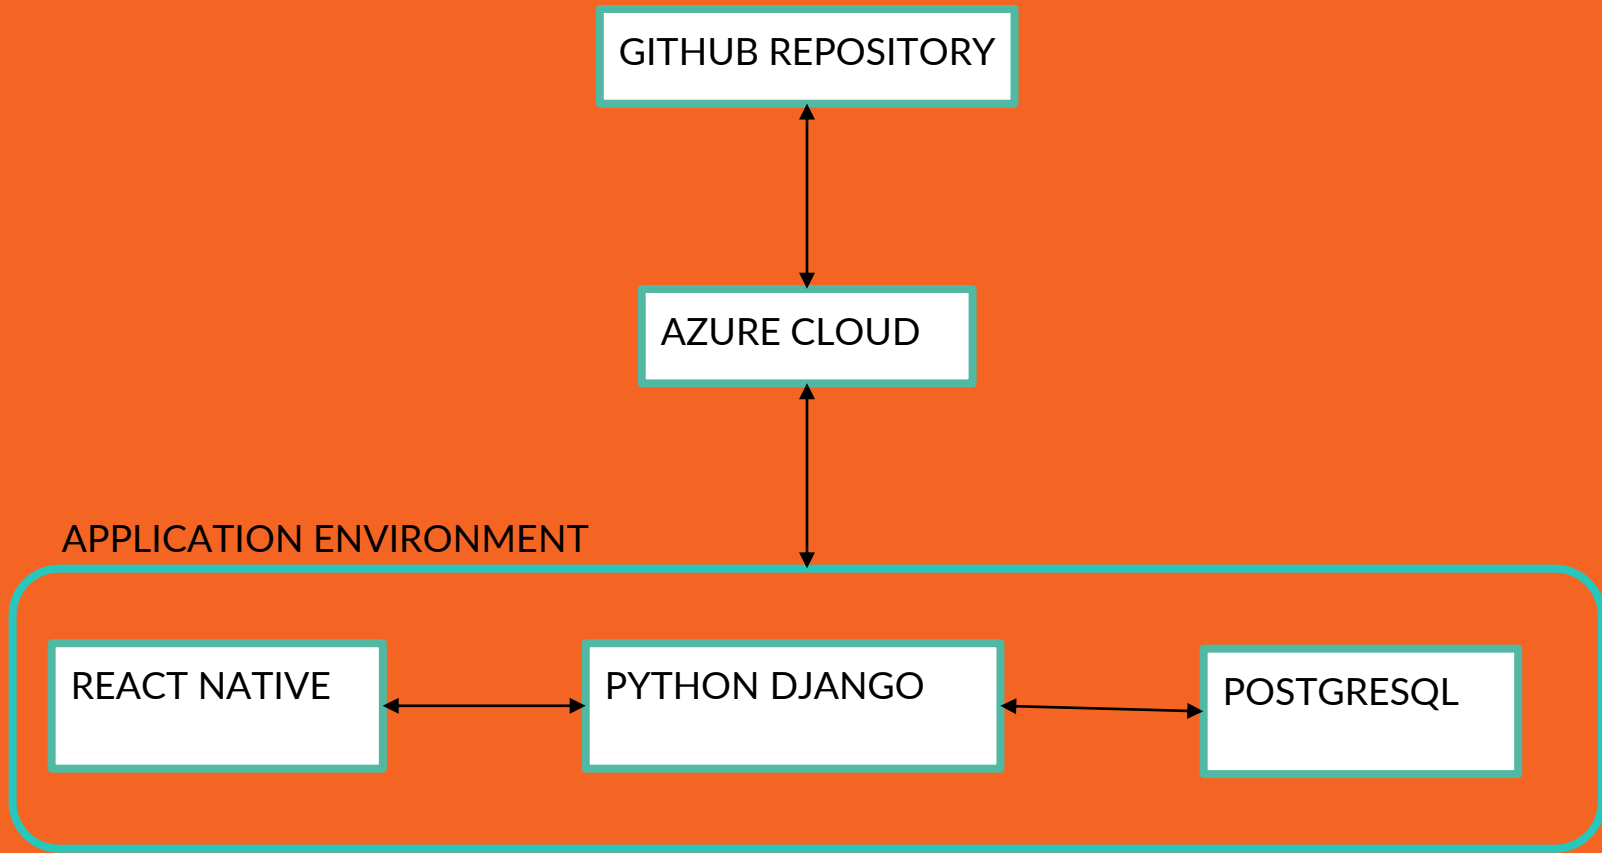

These are the AI functionalities that we shall be implementing into our application:

- Optical Character Recognition (OCR)

We shall be using OCR to enable our AI model to be able to capture user information and photos off identification documents and then save the information in a database.

- Face Recognition Technology

We shall ask the user to upload a photo of themselves and use facial recognition to compare image extracted off the identification document and the image uploaded to confirm that they are the same person.

---

# GITHUB REPOSITORY

[MrKintu/buzzhub: Instagram clone application that uses OCR and Face Recognition to register users. Built using React Native and Python Django using a PostgreSQL Database \(github.com\)](#)
